

SIZE DISTRIBUTION ?

Denis poncelet

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Size ?

From a few micrometers ... to a few millimeters

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Size ?

- Diameter = first property of the capsules
- Define largely
 - the membrane or coating surface, then quantity
 - the mechanical resistance
 - the fluidisation and flowing properties
 - the active loading and quantity
- Needed for most modelling of
 - the membrane formation
 - the release profile
 - the biocatalyst kinetics (mass transfer)

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Size distribution ?

- Mono-dispersion ?
 - do not believe pictures
- Narrow size distribution allows
 - better microcapsule formation control
 - easier modelling
 - more homogeneous properties
- Narrow size distribution
 - = higher cost & lower production

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Size distribution ?

Controlled release

$$\frac{dc}{dt} = -D \frac{(c - c')}{e}$$

$$\ln\left(\frac{c - c_o}{c_\infty - c_o}\right)$$

$$\ln\left(\frac{c - c_o}{c_\infty - c_o}\right) = -k t$$

Burst

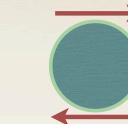

$c = 6\% c_o$

t

Burst effect? ... no size distribution

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

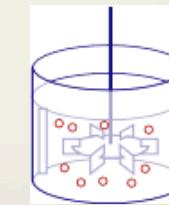

Mechanical resistance

$$v_{breakage} \div d^4$$

$d = 500$ to $1000 \mu\text{m}$

$v_{breakage}$ varies from 1 to 16

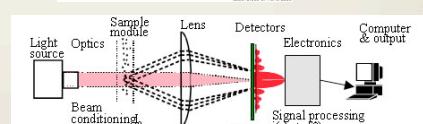

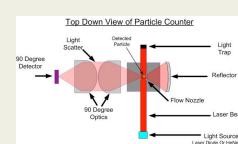

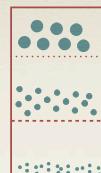

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

How to measure the size?

- Sieving analysis
- Microscopy
- Counting
- Laser diffraction
- Acoustic spectroscopy

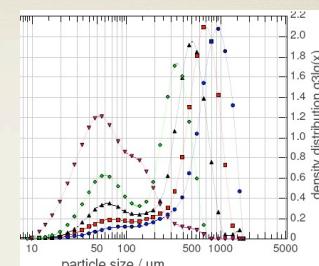

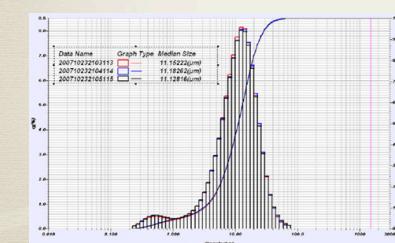

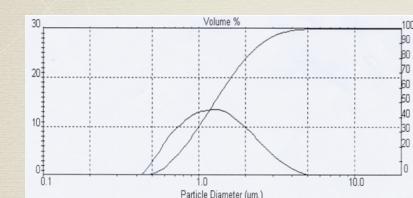

http://en.wikipedia.org/wiki/Particle_size_distribution

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

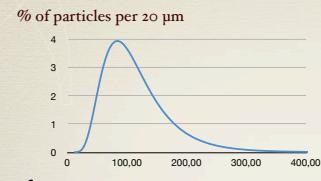

Size distribution

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

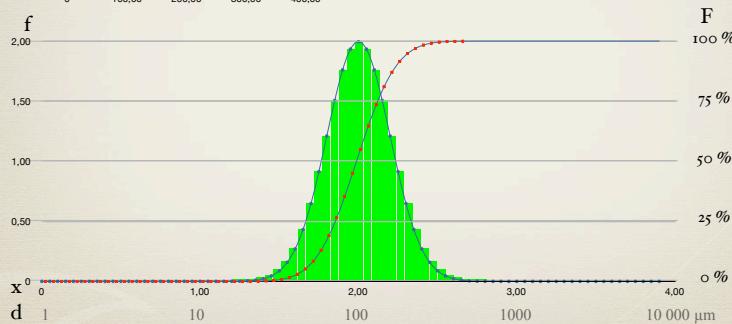

Histograms

$$f = \frac{dF}{dx} = \frac{1}{\sigma \sqrt{2\pi}} \exp^{-\frac{(x-\bar{x})^2}{2\sigma^2}}$$

$$x = \log(d)$$

$$F_x = \int_0^x f \, dx \quad \text{or} \quad \sum_0^x f \Delta x$$

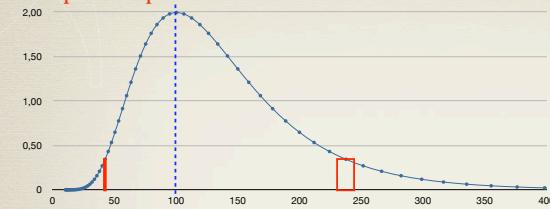

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

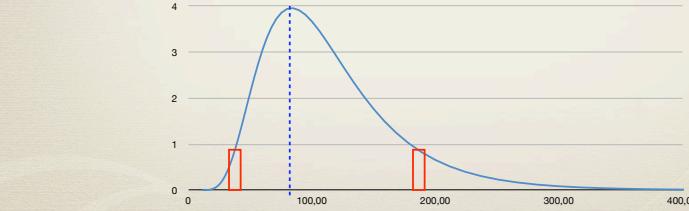

poncelet@enitiaa-nantes.fr

Histograms

% of particles per class

% of particles per 20 µm

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

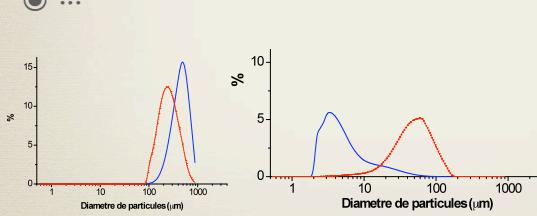

poncelet@enitiaa-nantes.fr

Frequency !

Frequency

- Numeric, f_n (microscope)
- Volumic, f_v (Malvern)
- Massic, f_m (sieving)
- ...

$$f_s = k \cdot x^3 \cdot f_n$$

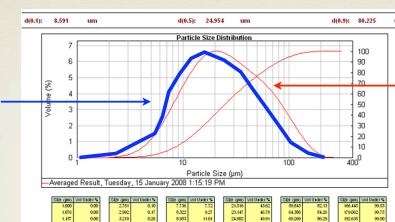

Hi-Maize 1043 D

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

F_v versus F_n

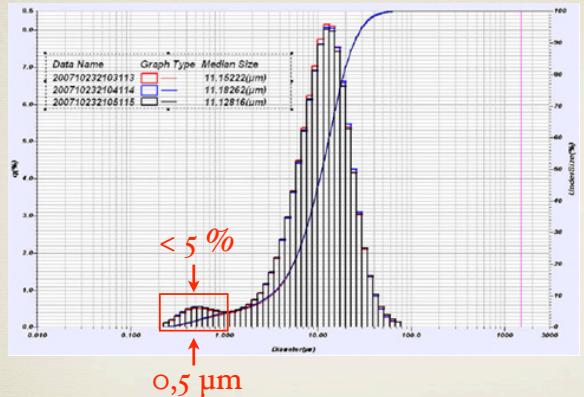

- Sampling is the key point
- Use raw data, avoid conversion
- Make tendencies not absolute values

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Artefacts

Most probably defaults assimilated to particles

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitia-nantes.fr

Mean size ?

● Median = diameter of 50 % cumulative frequency = $d_{50\%}$

● Mode = diameter of maximum frequency

● Mean size ?

- numeric (microscope)

$$d_n = d_{10} = \frac{\sum n_i \cdot d_i}{\sum n_i} = f_n \cdot d_i$$

- volume (Malvern)

$$d_{43} = \frac{\sum n_i \cdot d_i^4}{\sum n_i \cdot d_i^3} = \frac{\sum v_i \cdot d_i}{\sum v_i} = f_v \cdot d_i$$

$$d_v = d_{30} = \sqrt[3]{\frac{\sum n_i \cdot d_i^3}{\sum n_i}}$$

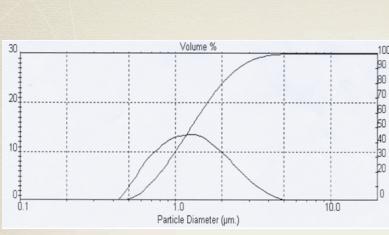

- surface

$$d_s = d_{32} = \frac{\sum n_i \cdot d_i^3}{\sum n_i \cdot d_i^2} = \frac{\sum s_i \cdot d_i}{\sum s_i} = f_s \cdot d_i = \frac{1}{a_s}$$

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitia-nantes.fr

Mean size ?

Mean size could be computed for all distributions

Multi-peaks ? multi-means ?

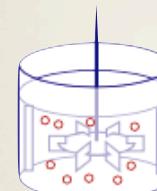

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitia-nantes.fr

Which mean ?

● Function of the applications / model

d_{32}

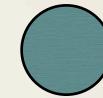

Emulsification
Mass transfer

d_{10}

Fluidisation

d_{30}

Loading
Yield

Sometime, mix of mean diameters

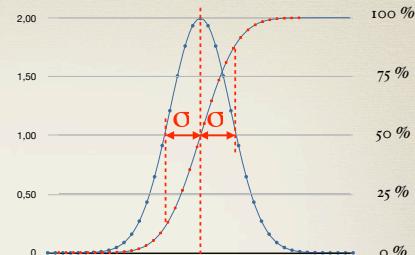

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitia-nantes.fr

Size dispersion ?

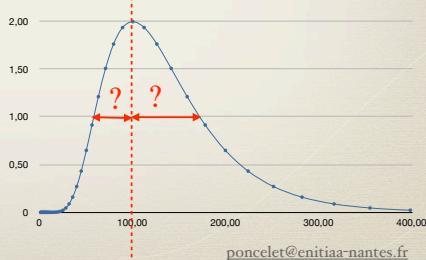

- standard deviation, σ

- graphically (!)
- $\sigma = (d_{64\%} - d_{16\%})/2$ (!)
- $\sigma^2 = \frac{\sum f_i(x_i - \bar{x})^2}{\sum f_i}$

- Distribution

- numeric or volumic
- normal or log-normal

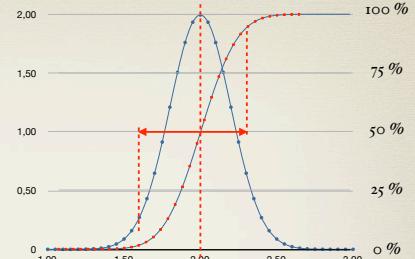

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Span ?

- Span = $(d_{90\%} - d_{10\%})/d_{50\%}$

- relative dispersion
- could be applied to all distributions
- take into consideration most particles
- deviations often under $d_{10\%}$ and over $d_{90\%}$

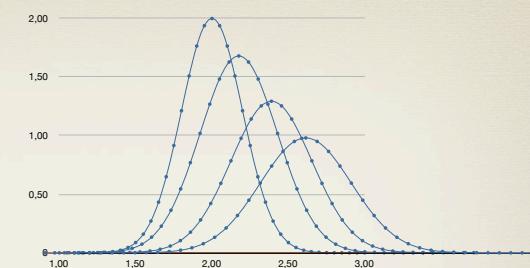

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

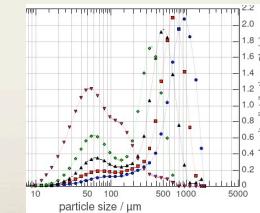

poncelet@enitiaa-nantes.fr

Standard deviation ?

- $\sigma' = \sigma / d_{50\%}$

- multi-peaks ?

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr

Conclusions

- Even (apparently) simple measurement needs standard
- Use simplest tool to measure the size
- Beware of the sampling
- Define your mean value
 - mode or median are easier
 - avoid conversion between distribution
- Use span to define dispersion
- Size distribution are not absolute value

ENITIAA, UMR CNRS 6144 GEPEA, Nantes, France

poncelet@enitiaa-nantes.fr
